

By combining Alfresco and SproutCore we have developed an ECM solution that's lightning-fast and multi-device compliant.

We have built a web application that shows what is possible when combining the robust ECM capabilities of **Alfresco** with **SproutCore**, a multi-device HTML5 and Javascript framework. While the app may have the exact functionality you need, it's more likely a foundation for something that can be customized and built upon to meet your organization's specific needs.

Features we are excited about:

- ▶ A feature-rich and lightning-fast user-interface optimized for both modern mobile devices and desktop computers alike.
 - ▶ A shift in business logic processing from the server to the client, providing fast, efficient, and scalable web applications that act like native desktop apps.
 - ▶ Solid framework for developing application/vertical specific features for powerful workflow, task, and document management
-
- ▶ Robust Alfresco file system interaction including audio/video/text previews, document editing, and file upload/download capabilities
 - ▶ Smart and asynchronous background data loading that allows for speeds rivaling that of a native desktop application.
 - ▶ Intuitive, interval-based invalidation of folder data providing a timed cache.
